# CHAPTER 1

## INTRODUCTION

### 1.1 PROJECT OVERVIEW

HANDWRITTEN digit recognition is the ability of a computer system to recognize the handwritten inputs like digits, characters etc. from a wide variety of sources like emails, papers, images, letters etc. This has been a topic of research for decades. Some of the research areas include signature verification, bank check processing, postal address interpretation from envelopes etc. Here comes the use of Deep Learning. In the past decade, deep learning has become the hot tool for Image Processing, object detection, handwritten digit and character recognition etc. A lot of machine learning tools have been developed like scikit-learn, scipy-image etc. and pybrains, Keras, Theano, Tensorflow by Google, TFLearn etc. for Deep Learning. These tools make the applications robust and therefore more accurate.

The Artificial Neural Networks can almost mimic the human brain and are a key ingredient in image processing field. For example, Convolutional Neural Networks with Back Propagation for Image Processing, Deep Mind by Google for creating Art by learning from existing artist styles etc.. Handwriting Recognition has an active community of academics studying it.

Classification of images and patterns has been one of the major implementation of Machine Learning and Artificial Intelligence. People are continuously trying to make computers intelligent so that they can do almost all the work done by humans Handwriting recognition system is the most basic and an important step towards this huge and interesting area of Computer Vision.

### 1.2 PURPOSE

Digit recognition systems are able to identify numbers from a variety of sources, including emails, bank checks, papers, images, etc. They can also be used in a variety of real- world situations, such as online handwriting recognition on computer tablets or systems, identifying vehicle licence plates, processing bank cheque amounts, and reading numbers from forms that have been filled out by hand (such as tax forms).

# CHAPTER 2

## LITERATURE SURVEY

### 2.1 EXISTING PROBLEM

The fundamental problem with handwritten digit recognition is that handwritten digits do not always have the same size, width, orientation, and margins since they vary from person to person. Additionally, there would be issues with identifying the numbers because of similarities between numerals like 1 and 7, 5 and 6, 3 and 8, 2 and 5, 2 and 7, etc. Finally, the individuality and variation of each individual's handwriting influence the structure and appearance of the digits.

### 2.2 REFERENCES

Hermans et al. have addressed the MNIST handwritten digit classification problem. In this context, 10 iterations are used for each image in the MNIST dataset; in other words, each input digit is repeated for 10 masking periods. In their experiments, the authors focused on both an MNIST handwritten digit classification dataset, and a TIMIT phoneme classification dataset. In both MNIST and TIMIT datasets, the authors found that optimizing the input encoding can make great improvements over random masks.

Mohapatra et al. proposed a new method for classifying MNIST handwritten digit images. In their new method, the authors used the discrete cosine space-frequency transform to extract image features and artificial neural network classifiers to solve the classification problem. In order to reduce the computational cost, the authors proposed to normalize all the images of the MNIST handwritten digit dataset and exclude undesirable boundary pixels.

Kussul and Baidyk proposed a new neural classifier limited receptive area (LIRA) for MNIST handwritten digit images classification. In the LIRA classifier, the sensor layer is followed with the associative layer, and the trainable connections are used to connect the associative layer with the output layer. Experiments with MNIST handwritten digit images show that the LIRA

classifier has achieved a classification accuracy of 99.41%.

In order to classify MNIST handwritten digit images, Ahlawata and Choudharyb proposed to build a hybrid classification model by integrating convolutional neural networks and support vector machines (SVM). In this context, the authors used convolutional neural networks to extract the features of the image, while SVM was used as a binary classifier. Based on experimental results the authors have achieved a classification accuracy of 99.28%.

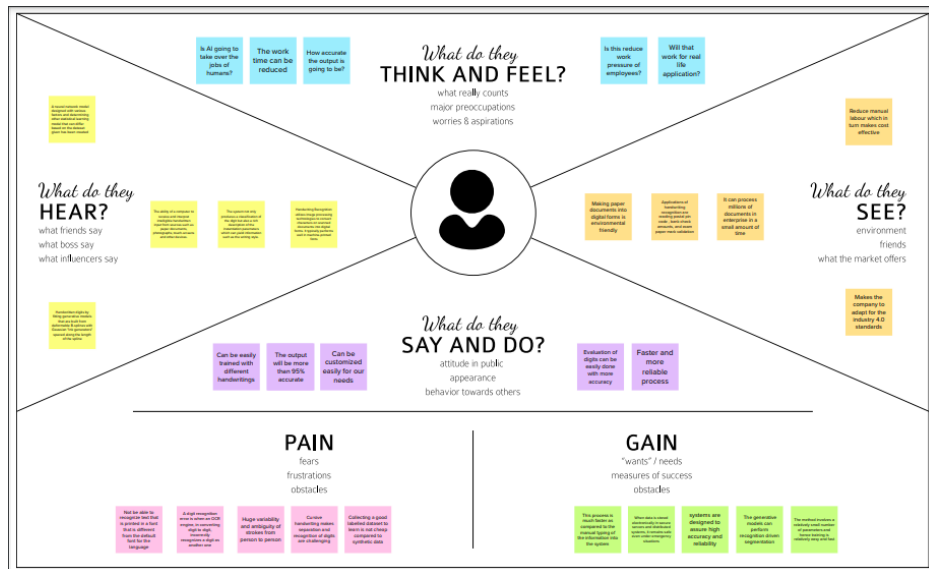

Chazal et al. proposed to use identical network topologies to compare between two weight optimization methods using MNIST handwritten digit classification database. In the first weight optimization methods, the authors use the extreme learning machine algorithm. While backpropagation algorithm is used in the second weight optimization methods. Based on their experimental results, the authors found that the weight optimization method that uses the extreme learning machine is much faster than the one that uses the backpropagation algorithm. Ma and Zhang adopted deep analysis with multi-feature extraction to build a handwritten digit classification method. In order to exclude negative information and maintain relevant features, the images of various sizes were normalized, and projection features were extracted from pre-processed images. Distribution features and projection features are also used to classify MNIST handwritten digit datasets.

## **2.3 PROBLEM STATEMENT DEFINITION**

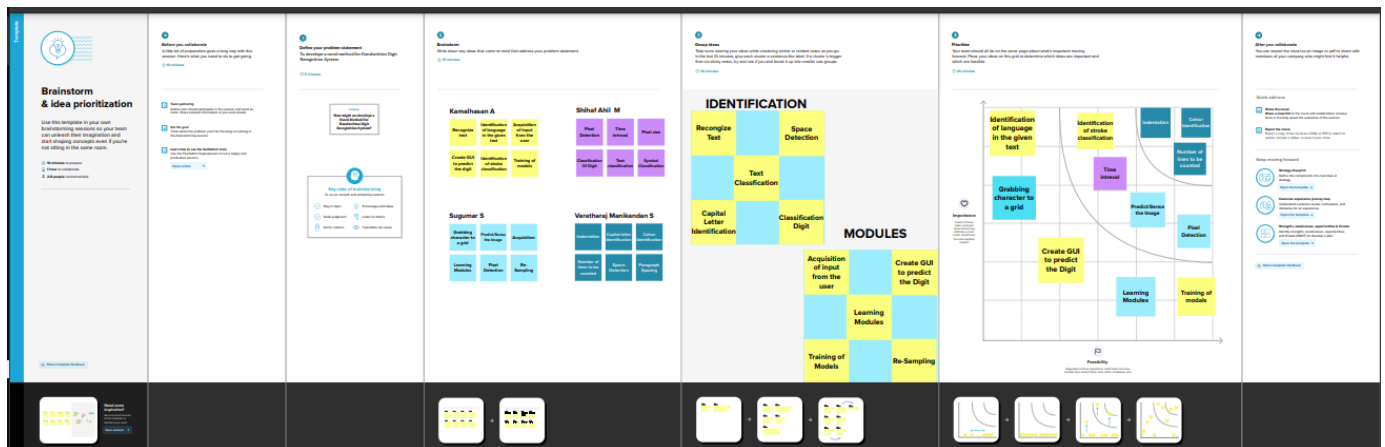

For years, the traffic department has been combating traffic law violators. These offenders endanger not only their own lives, but also the lives of other individuals. Punishing these offenders is critical to ensuring that others do not become like them. Identification of these offenders is next to impossible because it is impossible for the average individual to write down the license plate of a reckless driver. Therefore, the goal of this project is to help the traffic department identify these offenders and reduce traffic violations as a result.

## IDEATION AND PROPOSED SOLUTION

### 3.1 EMPATHY MAP CANVAS

### 3.2 IDEATION & BRAINSTORMING

### 3.3 PROPOSED SOLUTION

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Handwritten digit recognition is the ability of computer system to recognize the handwritten characters from wide variety of sources like emails, papers, images, etc. Manually written digits are of different sizes, styles, orientation, thickness and position. The model should be able to identify them and predict the output correctly.
2.	Idea / Solution description	To solve this problem, we are going to use Convolutional neural network. It is a type of Neural Networks and it is mainly used to identifying the image and speech recognition. It reduces the high dimensionality of image without losing of information. That's why CNNs are especially suited for this use case.
3.	Novelty / Uniqueness	<ul style="list-style-type: none"><li>• Training dataset contains more than 40,000 records.</li><li>• CNN is the model we have chosen.</li><li>• It recognises the digits with good accuracy.</li></ul>
4.	Social Impact / Customer Satisfaction	The main impact of this work is to reduce the errors that occurs in banking sectors. Due to the incorrect recognition of handwritten digits that are written in cheques and credit cards. So that this digit recognition will greatly improve the goodwill of the organization and customer satisfaction.

5.	Business Model (Revenue Model)	<p>Every one of us have different styles of writing and perception. Manually recognizing the handwritten digits are error prone due to various factors. So, if this digit recognition is done manually in business organizations, even if a single error occurs, it may cause severe damage to the organization. So here, we have proposed a solution to automate the digit recognition process. A deep learning model is trained with images of different styles, sizes, orientation and then the model is based to predict based on previous learning.</p>
6.	Scalability of the Solution	<p>We can extend this project into providing solutions to various other problems like solving handwritten mathematical equation by making some changes with the training data and final code. Organizations such as banks, revenue departments, accounting sectors are facing issues in recognizing written digits such as in cheques. This can be handled by our handwritten digit recognition project as they expand into different business domains without impacting performance. Our proposed solution is thus scalable and can fit into different domains and solve different problems.</p>

## 3.4 PROBLEM SOLUTION FIT

Define CS, fit into CC	<b>1. CUSTOMER SEGMENT(S)</b> <b>CS</b>  My customer is a bank manager he trying to Recognize the digits in cheque.	<b>6. CUSTOMER CONSTRAINS:</b> <b>CC</b>  The bank manager recognize the digit but is not clear because of unique style of handwriting.	<b>5. AVAILABLE SOLUTIONS:</b> <b>AS</b>  The bank manager can predict the cheque handwritten digit to complete the transaction.	Explore AS, differentiate
	<b>2. JOBS-TO-BE-DONE / PROBLEM:</b> <b>J&amp;P</b>  The cheque hand writing is not clear but the money transaction can not completed	<b>9. PROBLEMROOT CAUSE:</b> <b>RC</b>  Problem cause is hand written is not clear Hence the transaction is not complete	<b>7. BEHAVIOUR:</b> <b>BE</b>  The customer want to money transaction But the bank manager didn't understand the handwritten and digit hence the transaction is not compete	
Focus on J&P, up into BE, understand RC	<b>3. TRIGGERS</b> <b>TR</b>  Problem is hand written is not clear each check take more time the bank manger had irritated	<b>10. YOUR SOLUTION</b> <b>SL</b>  Use the MINIST Dataset to recognize handwritten digits convolutional neural network model created using pytorch library to solve the problem	<b>8. CHANNELS of BEHAVIOUR</b> <b>CH</b>  The customer want to money transaction But the bank manager didn't understand the handwritten and digit it's take more time hence the transaction is not compete he had annoyed	Focus on J&P, up into BE, understand RC
	<b>4. EMOTIONS:</b> <b>EM</b>  The cheque handwrittendigit is not understand it take more time the hence bank manager annoyed			
Identify strong TR & EM	Extract online & offline CH of BE			

# CHAPTER 4

## REQUIREMENT ANALYSIS

### 4.1 FUNCTIONAL REQUIREMENTS

FR No:	Functional Requirement and description
FR-1	<b>Image Data:</b> Handwritten digit recognition is the ability of a computer to recognize the human handwritten digits from different sources like images, papers, touch screens, etc, and classify them into 10 predefined classes (0-9). This has been a topic of boundless-research in the field of deep learning. In the realm of deep learning, this has been the subject of countless studies.
FR-2	<b>Website:</b> Web hosting makes the code, graphics, and other items that make up a website accessible online. A server hosts every website you've ever visited. The type of hosting determines how much space is allotted to a website on a server. Shared, dedicated, VPS, and reseller hosting are the four basic varieties.
FR-3	<b>Digit_Classifier_Model:</b> To train a convolutional network to predict the digit from an image, use the MNIST database of handwritten digits. get the training and validation data first.
FR-4	<b>MNIST dataset:</b> The MNIST dataset is an acronym that stands for the Modified National Institute of Standards and Technology dataset. It is a collection of 60,000 tiny square grayscale photographs, each measuring 28 by 28, comprising handwritten single digits between 0 and 9.
FR-5	databases, software, virtual storage, and networking, among others. In layman's terms, Cloud Computing is defined as a virtual platform that <b>allows you to store and access your data over the internet without any limitations.</b>

## 4.2 NON FUNCTIONAL REQUIREMENTS

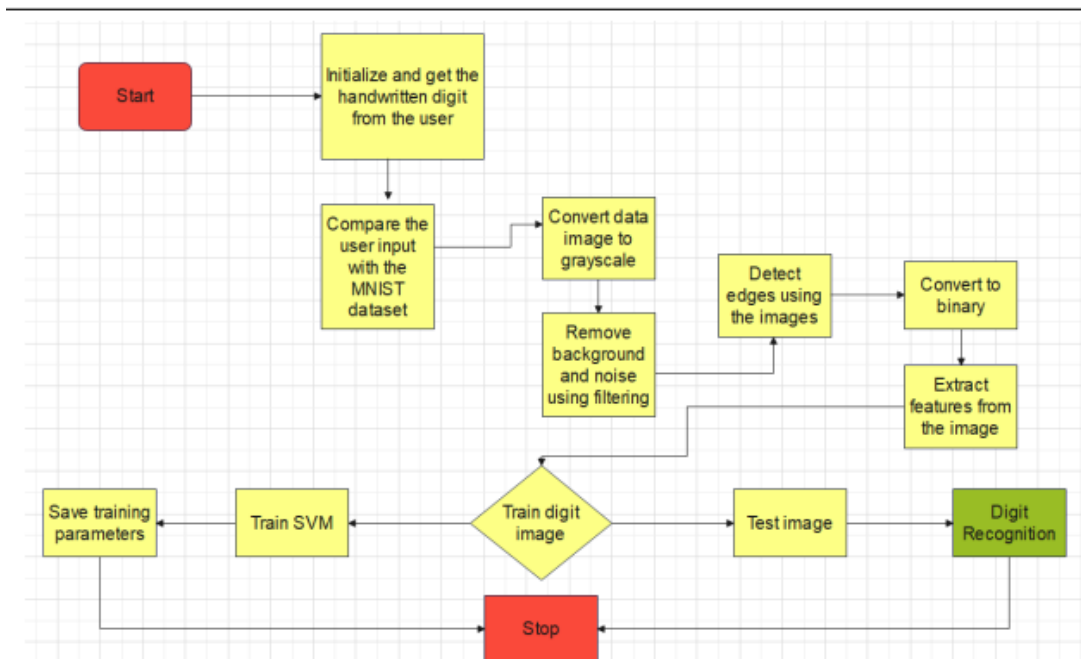

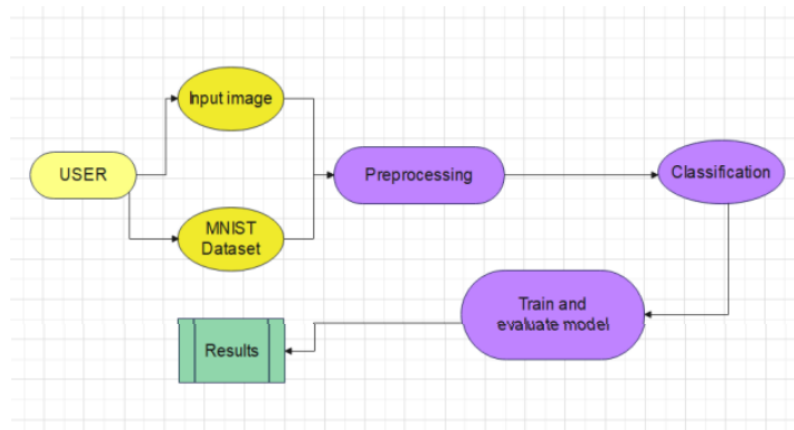

NFR No.	Non-Functional Requirement
NFR-1	<b>Usability:</b> Handwritten character recognition is one of the practically important issues in pattern recognition applications. The applications of digit recognition include postal mail sorting, bank check processing, form data entry, etc. One of the very significant problems in pattern recognition applications is the recognition of handwritten characters. Applications for digit recognition include filling out forms, processing bank checks, and sorting mail.
NFR-2	<b>Reliability:</b>  1) The system not only produces a classification of the digit but also a rich description of the instantiation parameters which can yield information such as the writing style. 2)The generative models can perform recognition driven segmentation. 3) The method involves a relative.
NFR-3	<b>Performance:</b> The neural network uses the examples to automatically infer rules for recognizing handwritten digits. Furthermore, by increasing the number of training examples, the network can learn more about handwriting, and so improve its accuracy. There are a number of ways and algorithms to recognize handwritten digits, including Deep Learning/CNN, SVM, Gaussian Naive Bayes, KNN, Decision Trees, Random Forests, etc.
NFR-4	<b>Accuracy:</b> Optical Character Recognition (OCR) technology provides higher than 99% accuracy with typed characters in high quality images. However, the diversity in human writing types, spacing differences, and irregularities of handwriting causes less accurate character recognition.

## PROJECT DESIGN

### 5.1 DATA FLOW DIAGRAM

Example: [\(Simplified\)](#)

## 5.2 SOLUTION & TECHNICAL ARCHITECTURE

## 5.3 USER STORIES

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Any common individual		USN-1	Receiving the digital form of the handwritten digits with a very high accuracy	Either write it on the webpage or scan the image of the written digit	High	Sprint-1
Bank officials	Separate registration	USN-2	Helps in understanding the amount and account number entered in demand draft and cheques in banks	Useful in characterizing the digits in banks	High	Sprint-2

Customer (Web user)	Home	USN-3	As a user, I can view the guide to use the webapp	I can view the awarenessof this application and its limitations.	Low	Sprint-1
		USN-4	As it is a web application, it is installation free	I can use it without the installation of the application or any software	Medium	Sprint-1
Any comm on person	Login	USN-5	As a user, I can log into the application byentering email & password		Low	Sprint-1

# CHAPTER 6

## PROJECT PLANNING AND SCHEDULING

### 6.1 SPRINT PLANNING AND ESTIMATION

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Data Collection	USN-1	As a user, I can collect the dataset from various resources with different handwritings.	10	Low	Kamalahasan A Varatharaj S
Sprint-1	Data Preprocessing	USN-2	As a user, I can load the dataset, handling the missing data, scaling and split data into train and test.	10	Medium	Shihaf Ahil M Sugumar S
Sprint-2	Model Building	USN-3	As a user, I will get an application with ML model which provides high accuracy of recognized handwritten digit.	5	High	Kamalahasan A Shihaf Ahil M Varatharaj S
Sprint-2	Add CNN layers	USN-4	Creating the model and adding the input, hidden, and output layers to it.	5	High	Shihaf Ahil M Sugumar S

Sprint-2	Compiling the model	USN-5	With both the training data defined and model defined, it's time to configure the learning process.	2	Medium	Sugumar S
Sprint-2	Train & test the model	USN-6	As a user, let us train our model with our image dataset.	6	Medium	Kamalahasan A Shihaf Ahil M Sugumar S
Sprint-2	Save the model	USN-7	As a user, the model is saved & integrated with an android application or web application in order to predict something.	2	Low	Kamalahasan A Varatharaj S
Sprint-3	Building UI Application	USN-8	As a user, I will upload the handwritten digit image to the application by clicking a upload button.	5	High	Kamalahasan A Shihaf Ahil M Varatharaj S

Sprint-3		USN-9	As a user, I can know the details of the fundamental usage of the application.	5	Low	Sugumar S
Sprint-3		USN-10	As a user, I can see the predicted / recognized digits in the application.	5	Medium	Kamalahasan A Shihaf Ahil M
Sprint-4	Train the model on IBM	USN-11	As a user, I train the model on IBM and integrate flask/Django with scoring end point.	10	High	Kamalahasan A Varatharaj S
Sprint-4	Cloud Deployment	USN-12	As a user, I can access the web application and make the use of the product from anywhere.	10	High	Kamalahasan A Sugumar S

## 6.2 SPRINT DELIVERY SCHEDULE

<b>SPRINT</b>	<b>TOTAL STORY POINTS</b>	<b>DURATION</b>	<b>SPRINT START DATE</b>	<b>SPRINT END DATE (PLANNED)</b>	<b>STORY POINTS COMPLETE (AS ON PLANNED DATE)</b>	<b>SPRINT RELEASE DATE (ACTUAL)</b>
Sprint - I	20	6 Days	24 Oct 2022	29 Oct 2022	20	29 Oct 2022
Sprint - II	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint - III	20	6 Days	07 Oct 2022	12 Nov 2022	20	12 Nov 2022
Sprint - IV	20	6 Days	14 Nov 2022	19 Nov 2022	20	19 Nov 2022

# **CHAPTER 10**

## **ADVANTAGES & DISADVANTAGES**

### **ADVANTAGES**

- Can be used anywhere from any device
- Manual work can be reduced
- Lot of data can be added
- Tends to be more accurate than humans

### **DISADVANTAGES**

- Complex data can't be handled
- Digital format is expected
- Requires a fast server
- Occasional errors might occur

# CHAPTER 11

## CONCLUSION

This project shows and suggests a web app that uses machine learning to identify handwritten numbers. The tech stack used here for the project are Flask, HTML, CSS, JavaScript. CNN network model is used to predict the handwritten digits. The model achieved a 99.61% recognition rate during the testing. This project is scalable and can easily handle a huge number of users.

This system is compatible with any device that can run a browser since it is a web application. This project is extremely useful in real-world scenarios such as recognizing number plates of vehicles, processing bank cheque amounts, numeric entries in forms filled up by hand (tax forms) and so on.

In subsequent versions much more improvement can be made.

# CHAPTER 12

## FUTURE SCOPE

This project has a lot of room for improvement and improvements can be made in the next versions. Some of the improvements that can be made to this project are:

- Multiple digits detection support can be added.
- Model to detect digits from complex images can be improved.
- Add support to detect from digits multiple images and save the results
- Multilingual support can be added to help users from all over the world

Implementing this concept in the real world will benefit several industries and reduce the workload on many workers, enhancing overall work efficiency. This system has endless advancement in the next versions and can always be improved to be better than this.

# APPENDIX

## SOURCE CODE MODEL CREATION
